COMMENTS:

- T/O : initial to take off incentered to the centerline → too slow set the aircraft to correct centerline by rudder
- X-wind : Needed more outside observation altitude and heading control was OK
- down wind : more look outside please, while maintain altitude & heading
- base leg : need little bit more correct on speed control, ok your descent altitude constantly (vis ± 400-300ft).
- final :- Need more effort to catch & keep centerline as long as possible on final "BY YOURSELF".
- any changing slope attitude tendency on short final → keep your slope and ok your speed.
- Land : standard & safe.
→ bounce recovery was OK, but still need more stable aircraft control before raising milky flaps.
- → Sim EFATO, just needed more drill. The procedures, first action was enough.

COMPLETION STANDARDS:

- Must perform the landing safely and with minimum instructor assistance.
- Safety and traffic pattern procedures must be adhered to at all times.

Note: BE Confident and do on yourself.
